

**ZOOPLANKTON VOLUMES
OFF THE PACIFIC COAST, 1957**

SPECIAL SCIENTIFIC REPORT-FISHERIES No. 326

**UNITED STATES DEPARTMENT OF THE INTERIOR
FISH AND WILDLIFE SERVICE**

EXPLANATORY NOTE

The series embodies results of investigations, usually of restricted scope, intended to aid or direct management or utilization practices and as guides for administrative or legislative action. It is issued in limited quantities for official use of Federal, State or cooperating agencies and in processed form for economy and to avoid delay in publication.

Special Scientific Report--Fisheries No. 326

Washington, D. C.
November 1959

Abstract

Basic data on volumes of zooplankton off the Pacific coast in 1957 are given, together with haul data for all plankton hauls taken on survey cruises of the California Cooperative Oceanic Fisheries Investigations. Plankton volumes were larger during February through April than the six-year average for these months, and progressively smaller during May through July than the six-year average. Distribution charts showing relative areal zooplankton abundance by month are included.

ZOOPLANKTON VOLUMES OFF THE PACIFIC COAST, 1957

The six reports in this series that appeared under the authorship of "Staff of the South Pacific Fishery Investigations" contained basic data for the seven-year period 1949 through 1955, but contained no distribution charts. Distribution charts for all routine cruises during these years were presented in Thrailkill, 1956. The report on zooplankton volumes for 1956 (Thrailkill 1957) and the present report for 1957 contain both basic data on zooplankton volumes and monthly distribution charts of zooplankton abundance.

Plankton samples are used by the U. S. Bureau of Commercial Fisheries in studying the early life histories of commercially important or potentially important fishes, including their distribution, abundance, and rate of survival. These collections are also used by Scripps Institution of Oceanography in studies of productivity.

These investigations are part of the California Cooperative Oceanic Fisheries Investigations, a program sponsored by the Marine Research Committee and carried out by the Scripps Institution of Oceanography of the University of California, the Bureau of Marine Fisheries of the California Department of Fish and Game, the California Academy of Sciences, the Hopkins Marine Station of Stanford University, and the U. S. Bureau of Commercial Fisheries, Biological Laboratory, La Jolla, California.

The vessels participating on each of the California Cooperative Oceanic Fisheries Investigations (CCOFI) cruises of 1957 are given in text table 1. The Black Douglas, operated by the Bureau of Commercial Fisheries made all the cruises between February and September 1957. Five vessels operated by the Scripps Institution of Oceanography took part in CCOFI cruises during the year. A chronological listing of CCOFI cruises for 1957, with information of the area covered and the numbers of stations occupied, are shown in text table 2. The stations occupied during 1957 are shown in figure 1.

The table in this report serves a twofold purpose: 1) as a record of basic haul data for all plankton hauls made during 1957, and 2) as a record of the volume of plankton obtained in each haul.

The information given for each plankton haul includes station number (column 1), position (columns 2 and 3), date and time of collection (columns 4 to 6), volume of water strained (column 7), estimated depth of haul (column 8), and volume obtained (columns 9 and 10).

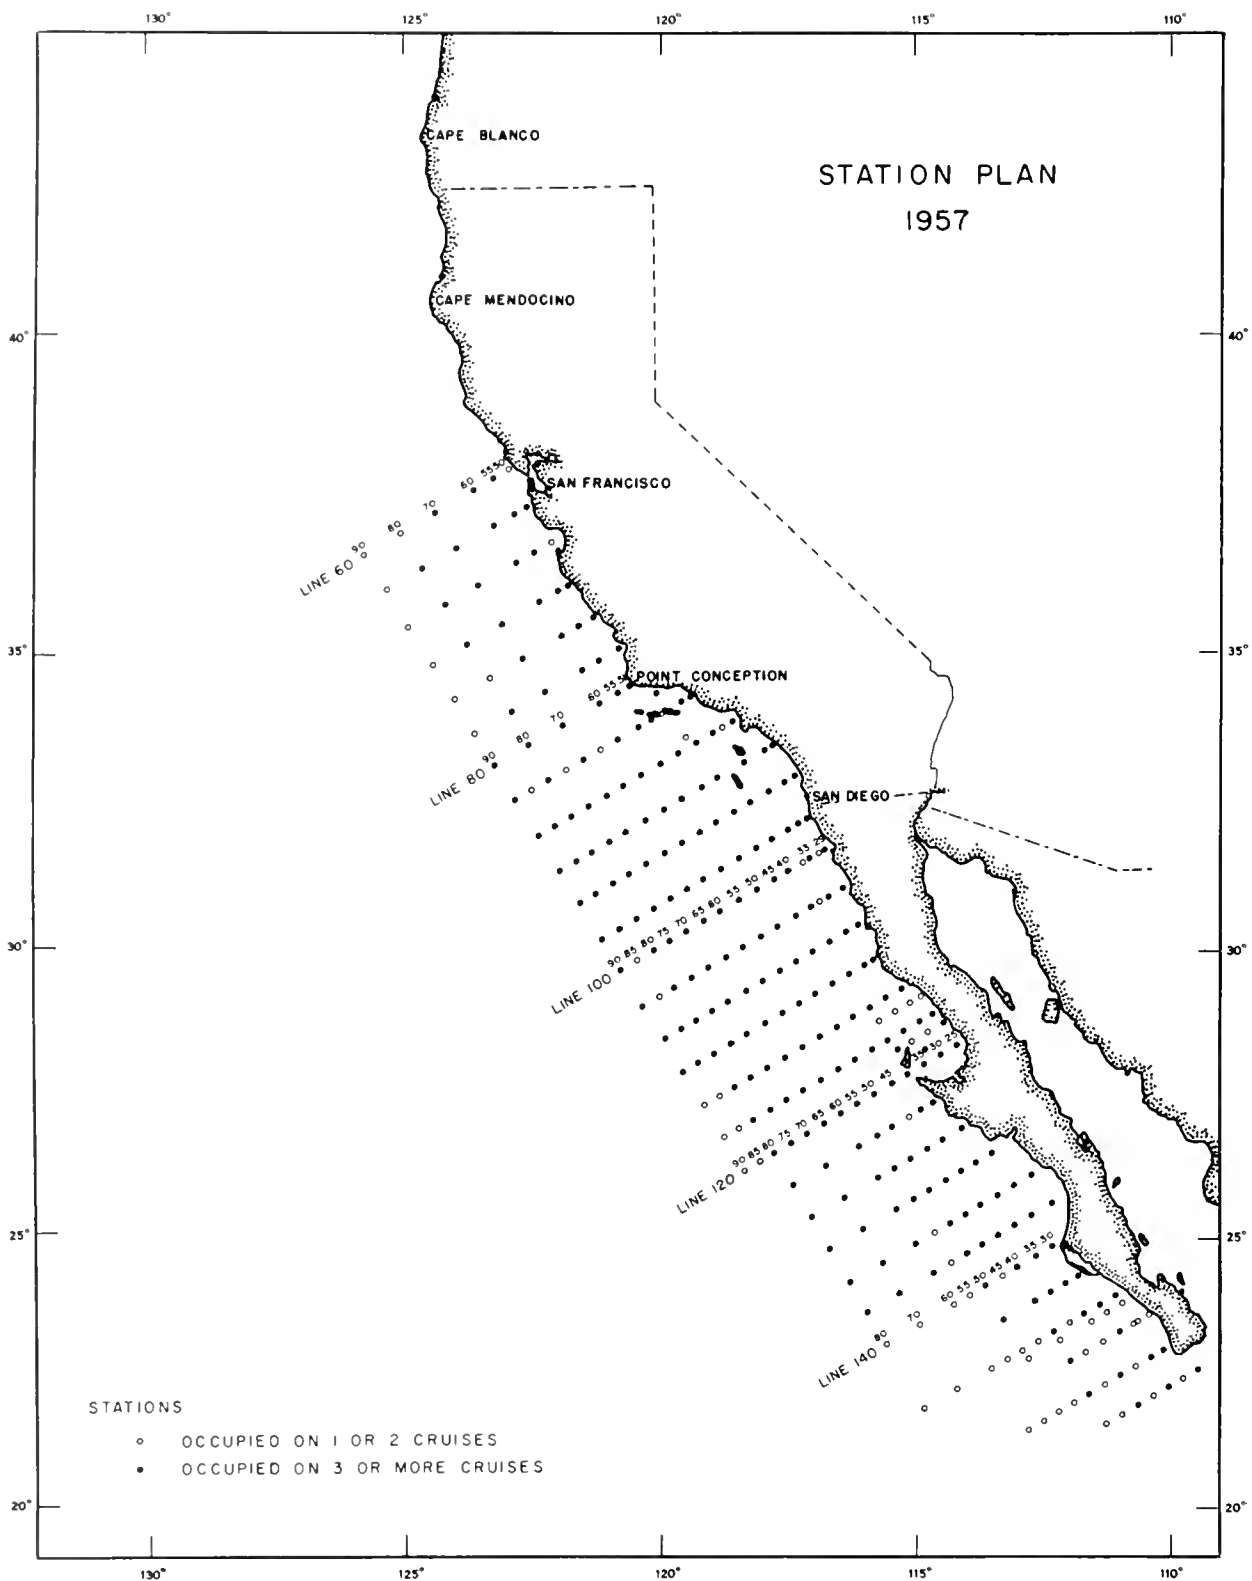

Figure 1.--Stations occupied on California Cooperative Oceanic Fisheries Investigations cruises during 1957.

October	5710	80-137	142
November	5711	70-97	44
December	5712	80-90 (110)	23

The method of determining the "wet" plankton volume of a sample is as follows: The plankton is separated from its preserving liquid (3% formalin) by filtering, allowed to drain, and then the displacement volume is obtained by placing the drained wet plankton in a graduated cylinder with a known volume of 3% formalin. Two volumes are obtained for each sample: the total wet volume of all plankton material, and the volume of smaller organisms. Larger organisms are arbitrarily limited to those whose volumes per individual exceed five cubic centimeters, and to juvenile and adult fishes irrespective of volume. These volumes are then standardized to the amount in one thousand cubic meters of water strained.

The distribution charts included in this report are based on the volume of smaller organisms only. In order to obtain a good contrast between light and heavy concentrations of plankton, five categories of abundance are used: (1) light, 0 to 33 cc. of plankton, (2) moderate, 34 to 100 cc. of plankton, (3) average, 101 to 300 cc. of plankton, (4) fairly heavy, 301 to 900 cc. of plankton, and (5) heavy, more than 900 cc. of plankton. The distribution charts are of two kinds: a chart based on the average plankton volumes at each station during the year (fig. 3), and a series of monthly charts (figs. 4-15) which accompany the plankton volume data.

Plankton nets used during 1957 were constructed of either No. 30xxx grit gauze (an extra heavy type of silk bolting cloth) or of nylon bolting cloth of fairly similar mesh size. The nets were 1 meter in diameter at the mouth, and approximately 5 meters in overall length.

Each haul was an oblique tow made from approximately 140 meters deep to the surface (depth of water permitting). Since 1951, this has been our standard method of taking net tows; therefore, in this report, the 1957 plankton volumes are compared only with those taken from 1951 through 1956 (fig. 2). During 1949 and 1950, the tows were taken from depths of about 70 meters to the surface.

Comparison of 1957 plankton volumes with those obtained in 1951-1956

The portion of the CCOFI survey area that has been most consistently occupied lies between Point Conception, California, and Point San Juanico, Baja California (station lines 80-137). In other studies (Ahlstrom 1954), this area has been divided into two roughly equal parts: a northern portion comprising the station lines off southern California and northern Baja California (lines 80-107), and a southern portion made up of the station lines off central Baja California (lines 110-137). This division is followed in comparing 1957 plankton volumes with those of previous years.

Coverage of these areas usually has been obtained at monthly intervals during the period of heavy sardine spawning, the first seven months of the year, and less frequently and less completely during the remaining five months of each year.

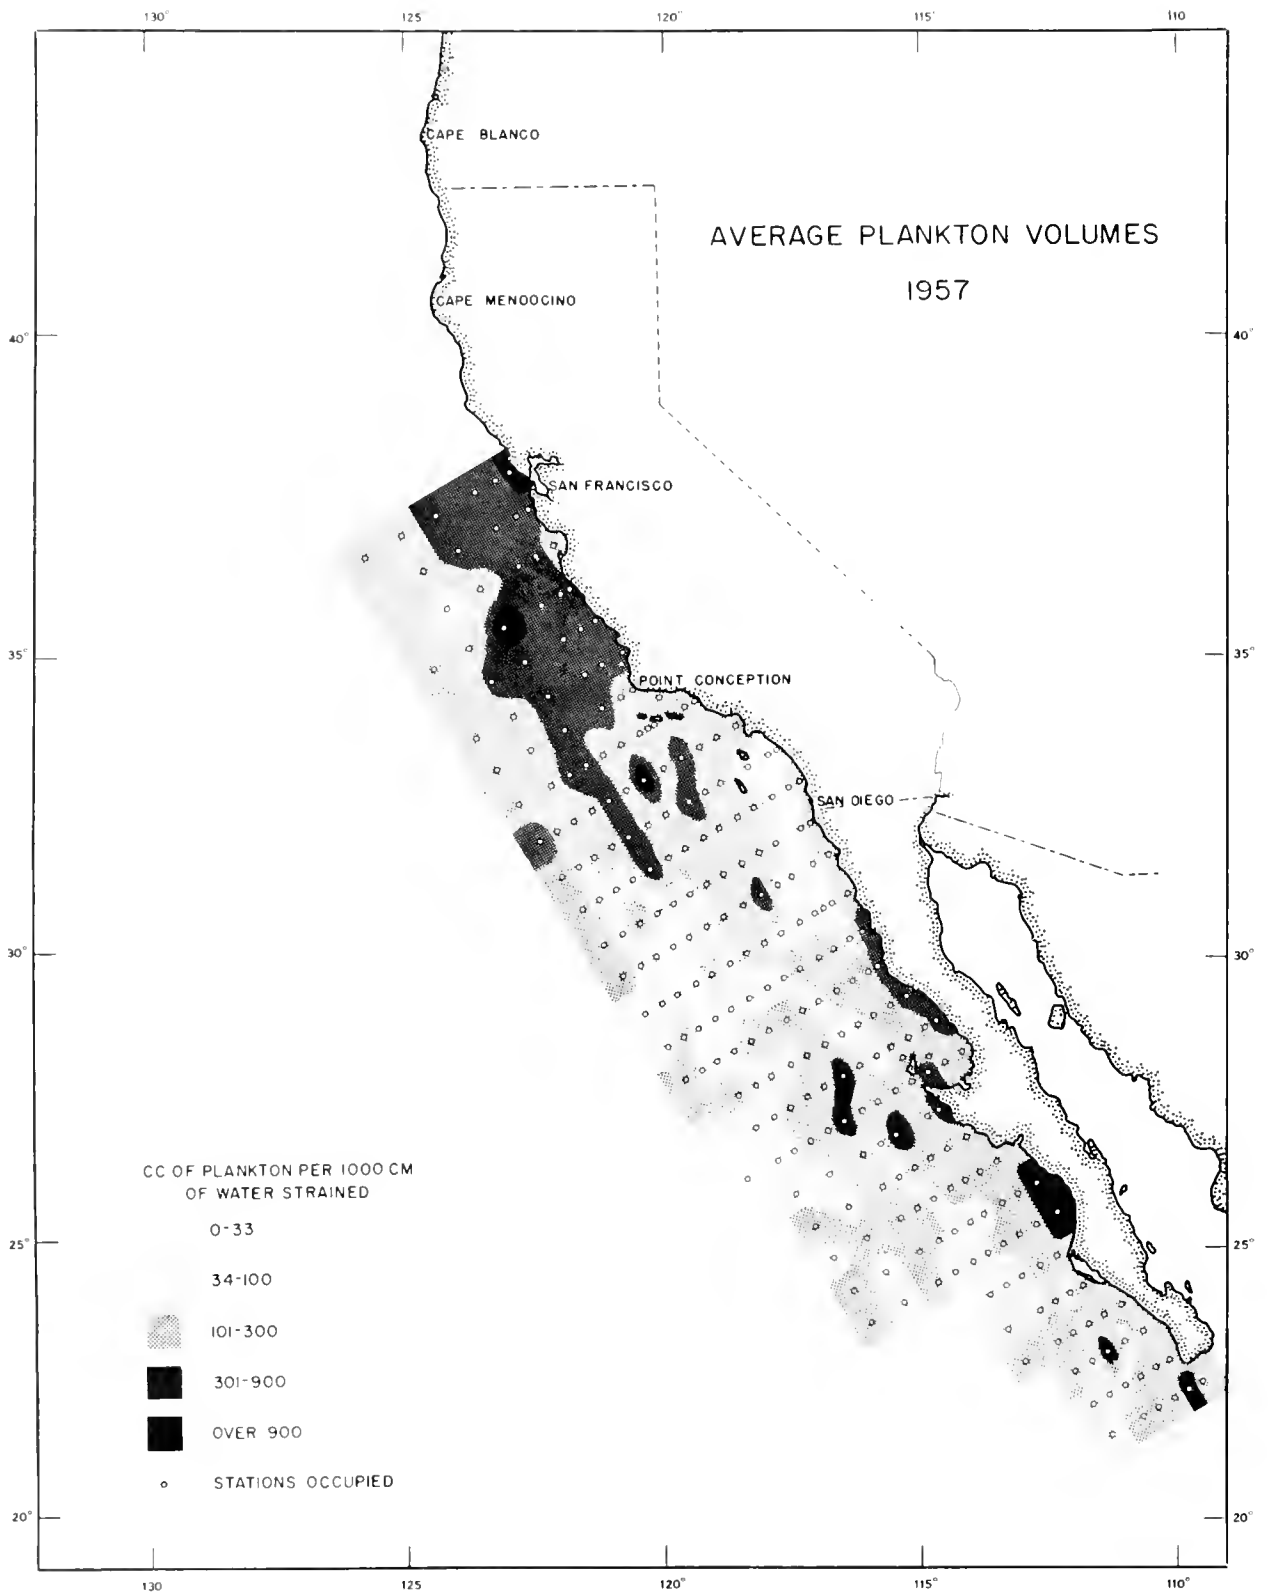

Figure 3.--Average plankton volumes, 1957

Unfortunately, there was a limited coverage during the January 1957 cruise (5701). Two vessels had been scheduled to make this cruise, but only one participated due to emergency repair of the other. Most of the stations occupied were in the southern area. There was no coverage in the area off southern California and northern Baja California during August and September 1957, and partial coverage during November and December. The area off central Baja California was occupied monthly between January and October with coverage limited to the inshore portion during August and September. This area was not occupied during November and December 1957.

The average monthly plankton volumes taken in the area off southern California and northern Baja California (station lines 80-107) for the months of February through July, 1951-1957, are given in text table 3. The average monthly plankton volumes in the area off central Baja California (lines 110-137) for the same time period are summarized in text table 4.

The average volume of plankton obtained on each cruise during 1957 is compared with the monthly averages of the preceding six years (1951-1956) combined in figure 2. In the area off southern California and northern Baja California, plankton volumes reached a peak in April 1957 and decreased markedly thereafter. Volumes were larger during February through April than the six-year average for these months, and progressively smaller during May through July than the six-year average.

In the area off central Baja California, 1957 plankton volumes were not as markedly different from those of the preceding six-year period as in the northern area. The largest volumes were taken earlier in the year, however, the peak month in this area being March in 1957, with volumes progressively decreasing thereafter through August.

It is with deep pleasure that the author acknowledges the cooperation given by the Scripps Institution of Oceanography in the collection of data at sea. All personnel of the Bureau of Commercial Fisheries Biological Laboratory, La Jolla, California, contributed to this project - many devoting their full time to it.

Text table 3.--Average monthly plankton volumes in the area off southern California and adjacent northern Baja California (sta. lines 80-107) for the months of February through July, 1951-57.
